

2013 New Security Paradigms Workshop
The Banff Centre, Banff, Canada
September 9-12, 2013
<http://www.nspw.org>

The New Security Paradigms Workshop (NSPW) invites papers that address the current limitations of information security.

Today's security risks are diverse and plentiful — botnets, database breaches, phishing attacks, targeted cyber attacks, social engineering — but present tools for combating them are insufficient. To address these limitations, **NSPW welcomes unconventional, promising approaches to important security problems and innovative critiques of current security theory and practice.**

We are particularly interested in perspectives from outside computer security, both from other areas of computer science and other sciences that study adversarial relationships such as biology, economics, and the social sciences.

NSPW is a highly interactive venue, with informal paper presentations, lively, extended discussions, shared activities, and group meals, all in the spectacular setting of The Banff Centre, Canada. By encouraging participants to think “outside the box” and giving them an opportunity to communicate with open-minded peers, NSPW seeks to foster paradigm shifts in the field of information security.

In 2013, NSPW will be held at The Banff Center, Canada, from September 9th to 12th. Stay tuned for more information at <http://www.nspw.org> soon.
